THE AR CLOUD

Ori Inbar

Super Ventures

September 2017

"The AR Cloud, will be the single most important software infrastructure in computing, far more valuable than facebook's Social graph or Google's page rank index."

THE AR CLOUD

The next big thing

Exponentially improving tech

Will affect all aspects of our lives

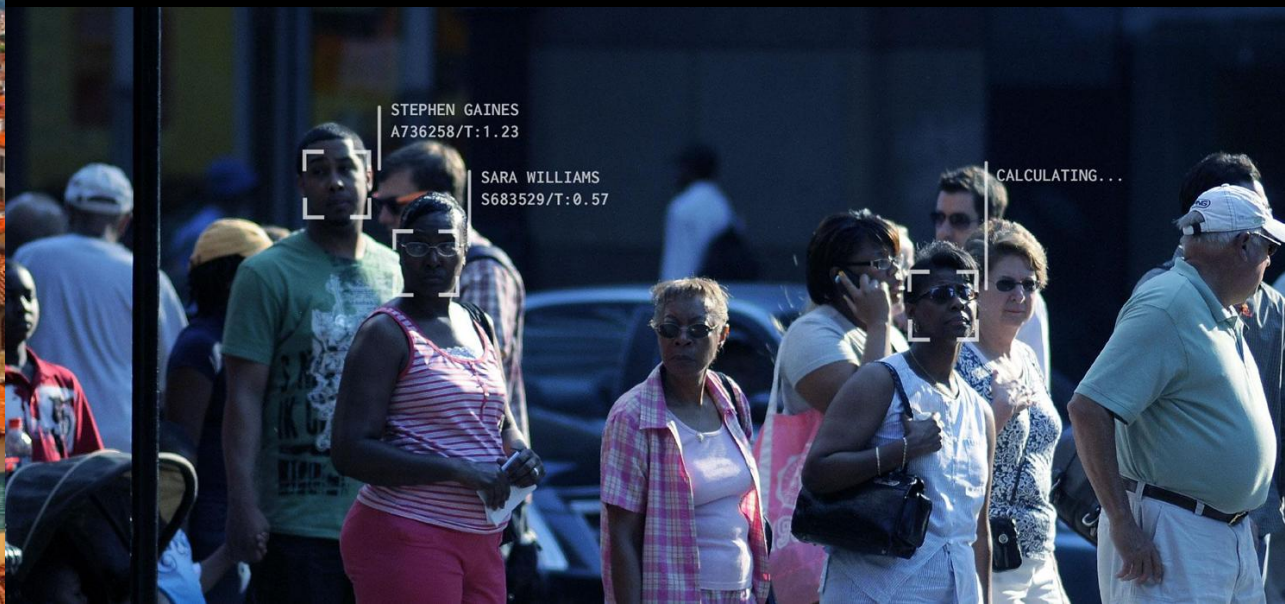

DIGITAL RENAISSANCE?

utopia

dystopia

A group of attendees at AWE got together around shared concerns on how this powerful new technology could go very wrong instead of realizing benefits for all.

Main threats:

- Lock-in to proprietary platforms
- Concentration and abuse of power
- Privacy and security risks

AWE Santa Clara June 2018

OPEN
AR CLOUD

The Open AR Cloud (OARC) is a **global non-profit organisation** founded in 2018 with the mission to drive the development of **open and interoperable spatial computing technology, data, and standards** to connect the physical and the digital worlds for the benefit of all.

AWE Munich 2018

OPEN
AR CLOUD

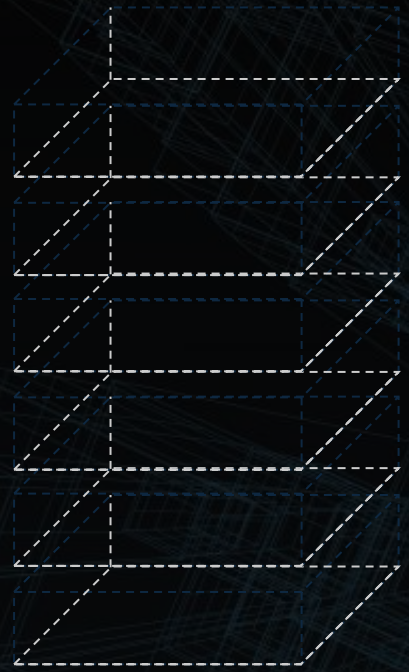

Mission condenced:

…to connect the **physical** and the **digital** worlds for the **benefit of all**

© 2019 Open AR Cloud Association

Layers of the **AR Cloud**

A layer can contain experiences, static content, live datastreams, services, applications/solutions etc. There needs to be a shared way of registering all such things to one or more layers.

THEMATIC LAYERS Examples

IoT

Art

Entertainment

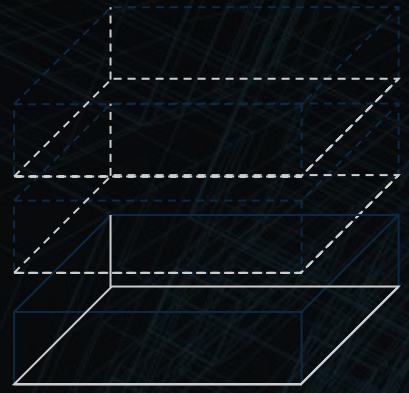

Commerce

Construction/Infrastructure

Mobility

BITS: Digital representations of the real world

ATOMS: Real world

REALITY CAPTURE LAYERS

Real-time reality layer

Transient dynamic state - restricted to only be shared locally at the edge to protect privacy, except emergency)

Static reality layer

Static persistant reality -may be shared globally

Physical reality

OPEN AR CLOUD

The reference / demonstration

Open Spatial Computing Platform (OSCP)

Standards

GeoPose

RML* / GML

Geo-glTF

Protocols

GeoPose Request & Response

RML* Subsription Query

SDS Protocol

Services

- GeoPose service
- Reality Service – provides RML*
- Spatial Discovery Service (SDS)
- Scene Understanding Service
- Shared Spatial Data Service

Client / Platform consumer

Smartphone client

AR-glasses client

RML* = Stand in for a «Reality Modeling Language» – like GML ++

The Open Web Platform

Standards

HTML

DOM

URL / URI

JavaScript

CSS

Protocols

HTTP

TCP/IP

Services

Web-server

DNS server (nameserver)

Clients

Web browser

The collection of open (royalty-free) technologies which enables the Web. Using the Open Web Platform, everyone has the right to implement a software component of the Web without requiring any approvals or waiving license fees.

The Real World
Spatial Web

The biggest tech convergence we have ever seen?

AI

Smartcity

Smart mobility

Geospatial / GIS

OSCP/
SPATIAL WEB

5G/Edge

SustainabilityTech

IoT

XR & RealityWeb

A core group of AR-tech geeks got to work:

Some highlights

2019: Started Implementing first version of the **Open Spatial Computing Platform**

2020: Started OGC Standards Working Group on **GeoPose** and initiated **city scale OSCP testbeds**

2021: Got NGI-Atlantic funding – build first **Open Source OSCP clients** and did our first exploration towards Open Source VPS

2022: Co-founded the Metaverse Standards Forum and became key contributor.

2025: Released first working Open Source VPS – on Github. Started development of RML and Spatial D

State of the art: How are things actually going in 2025?

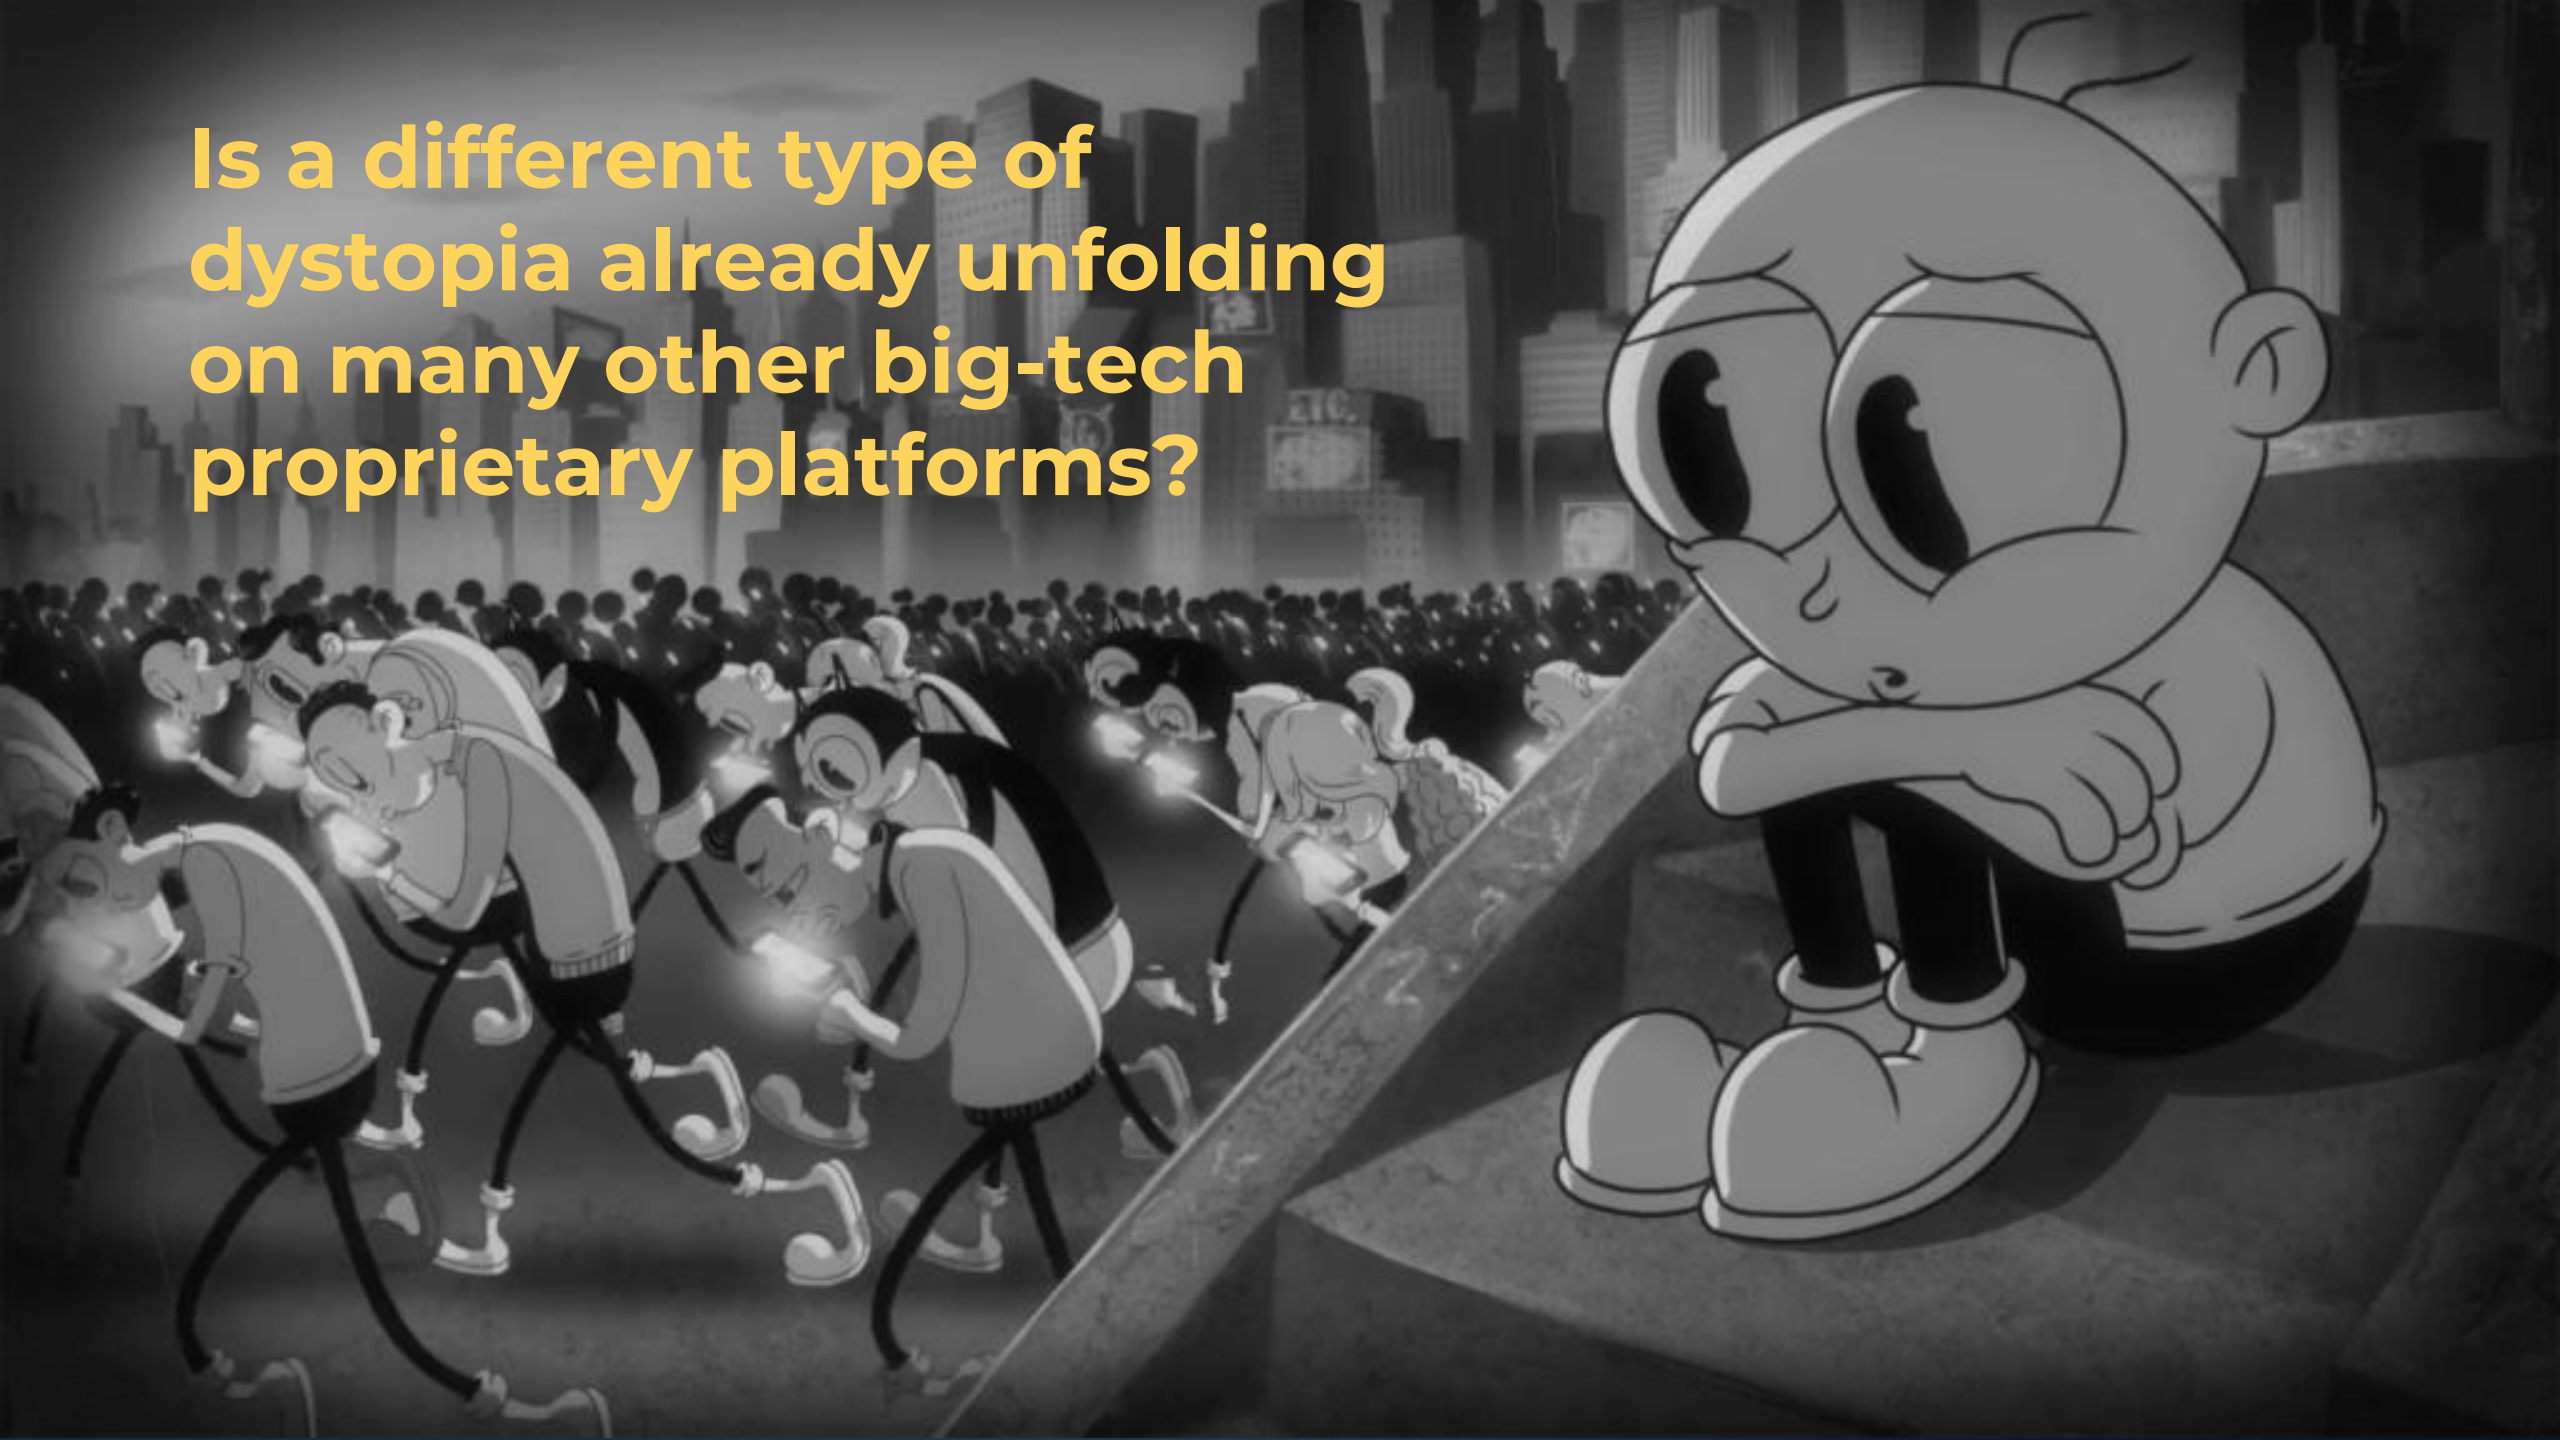

State of the art: How are things actually going in 2025?

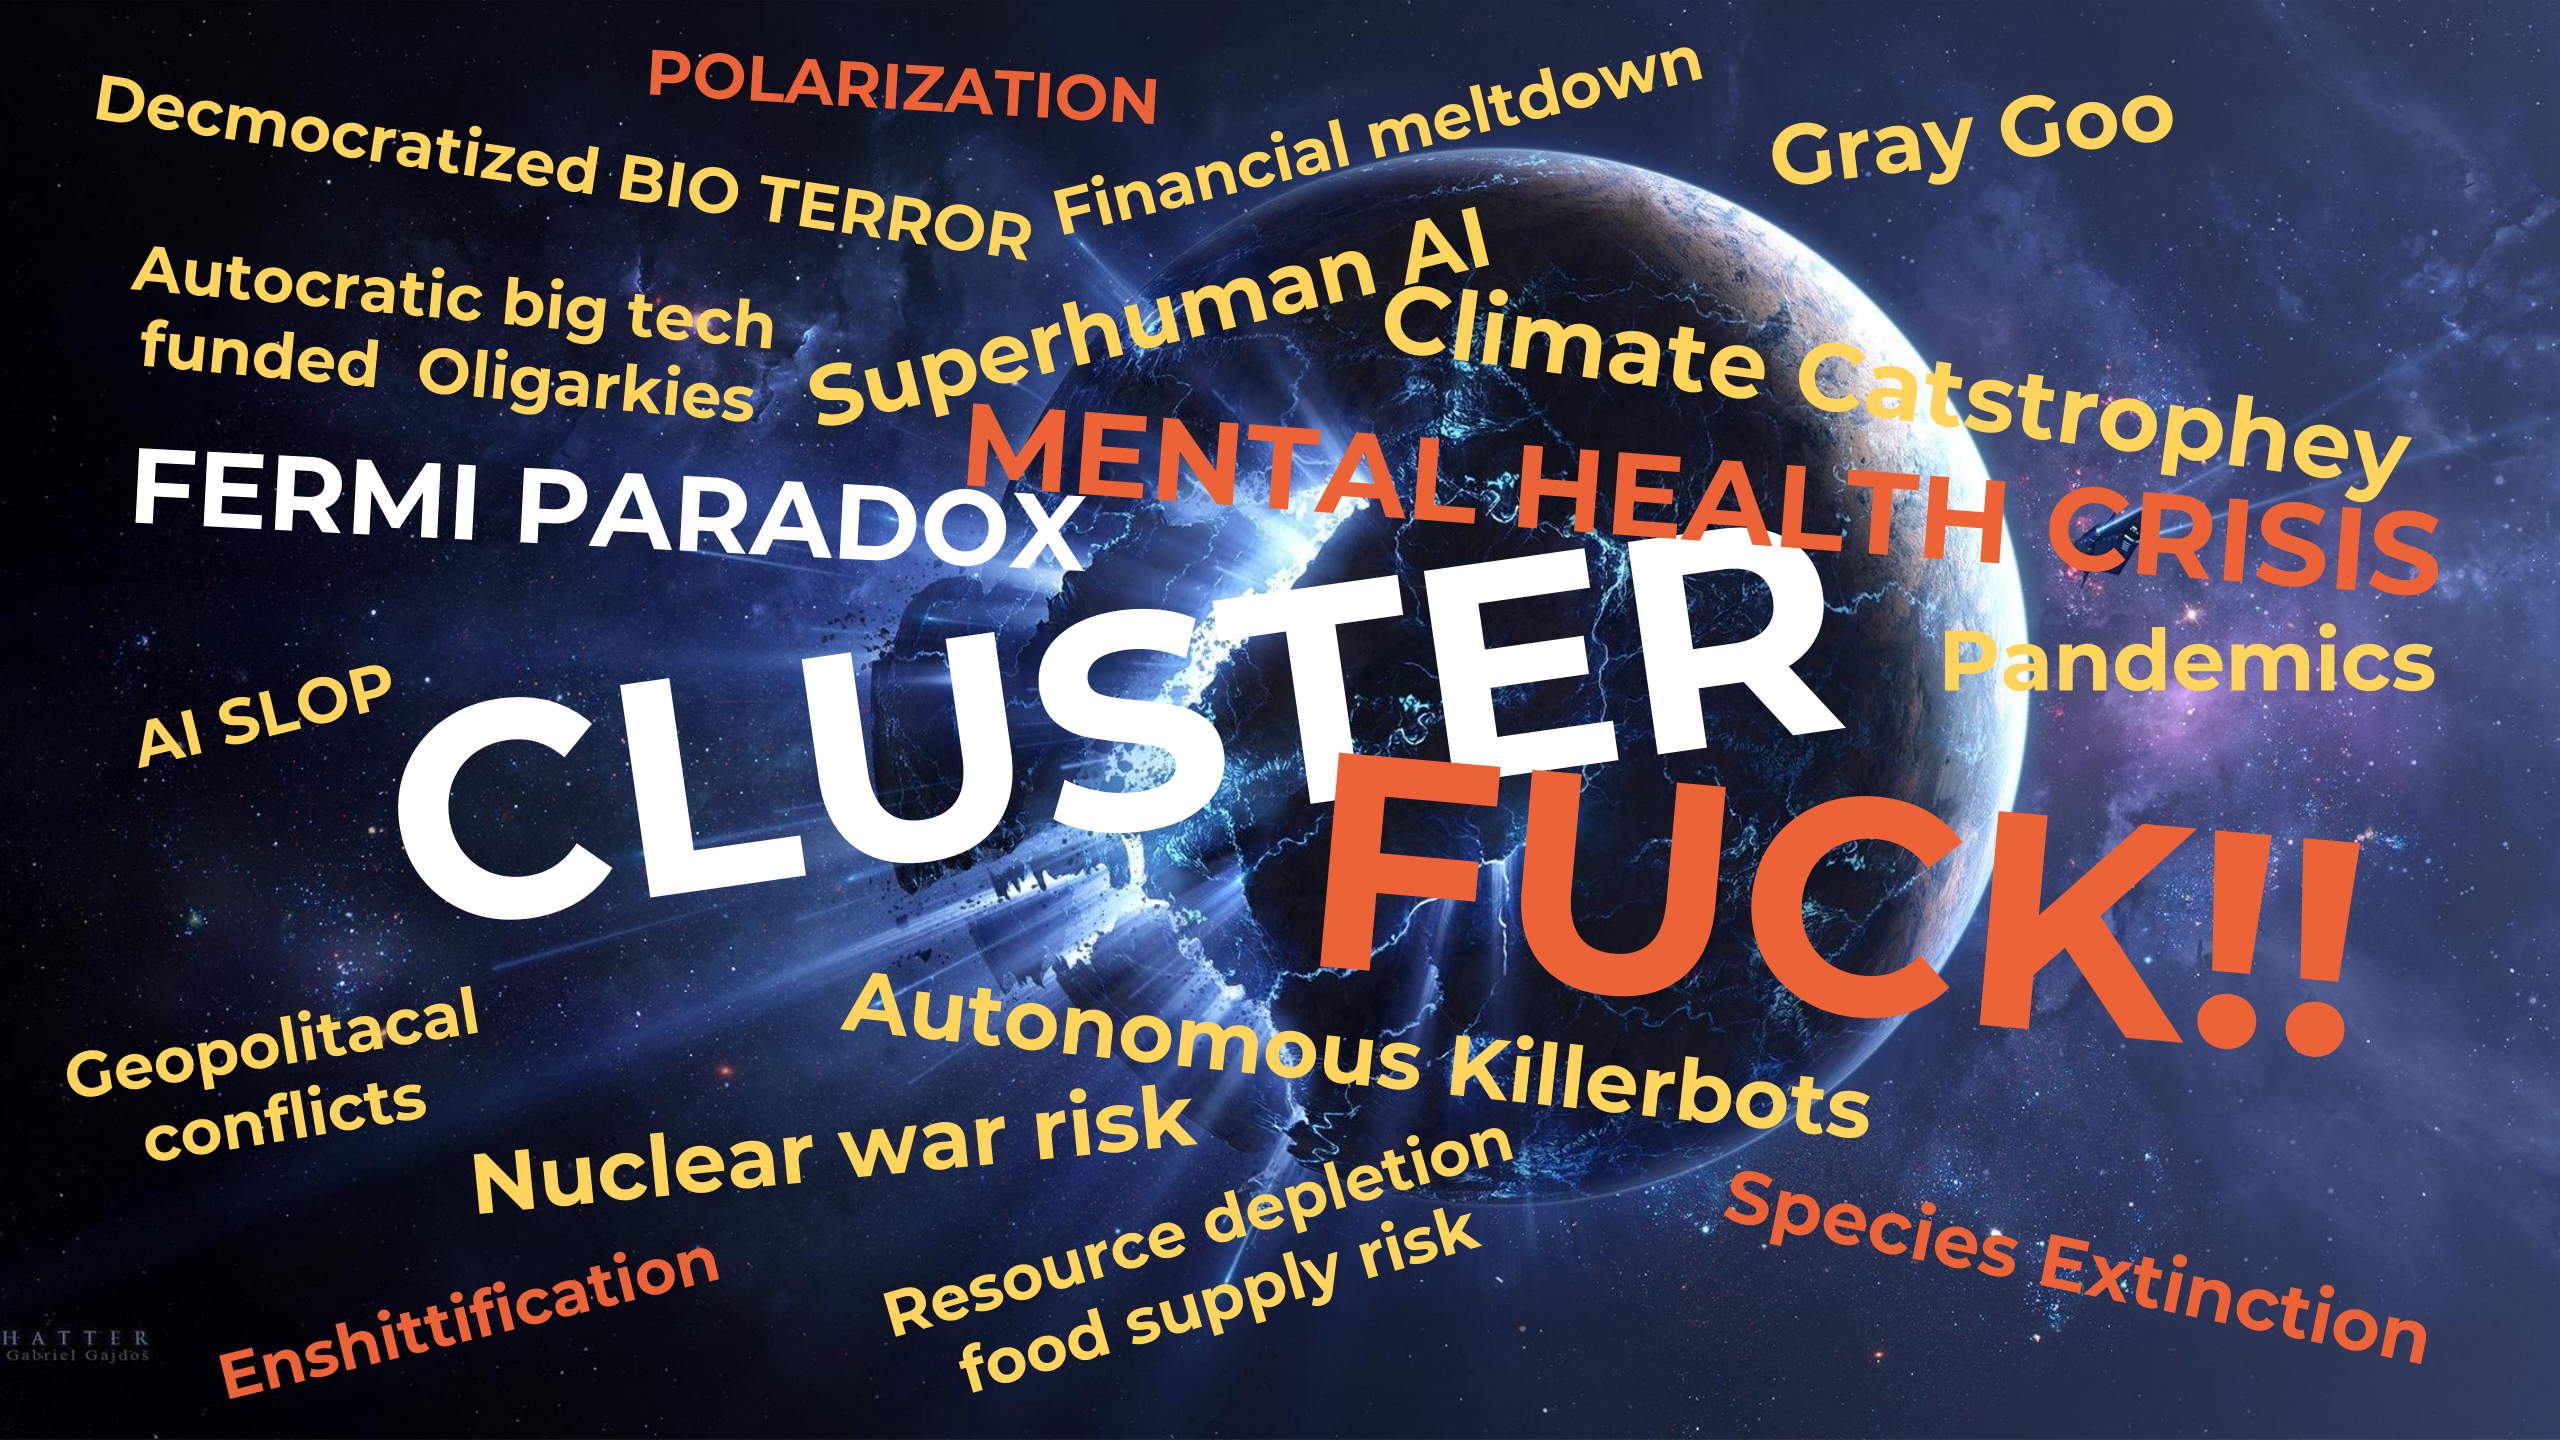

State of the art: How are things actually going in 2025?

This tech has neither brought about a Digital Renaissance nor a Black Mirror dystopia.

- No Spatial Web yet
- VPS is still very challenging
- We don´t yet have great AR Glasses

Is a different type of dystopia already unfolding on many other big-tech proprietary platforms?

POLARIZATION
Decmocratized BIO TERROR
Financial meltdown
Gray Goo
Autocratic big tech funded Oligarkies
Superhuman AI
Climate Catstrophey
MENTAL HEALTH CRISIS
FERMI PARADOX
CLUSTER
FUCK!!
Pandemics
AI SLOP
Geopolitacal conflicts
Autonomous Killerbots
Nuclear war risk
Resource depletion
food supply risk
Species Extinction
Enshittification
HATTER

Hope and inspiration from the most unexpected place...

Utah’s Digital Choice Act

Effective July 2026

The Utah Digital Choices Access law mandates that users can take their entire social graph to new services. It requires platforms to choose a fair, non-discriminatory, interoperable protocol (like ActivityPub, AT Protocol, or DSNP) , with the state publishing qualifying technical standards.

Choose to be on the right side of history!

Join the resistance against big-tech platform monopolies!

Build the open standards and protocol based spatial computing infrastrurcture we as part of the future we actually want.
